This is what I've had back from the designer. My initial thoughts is that it looks very clean and structured, but my concern is that it looks too corporate-y (but maybe that's a good thing?) and there's a lack of a workspace feeling, missing a key action-driven and tracking element that is required to make the platform sticky. Can you provide feedback and suggest changes to make the experience feel more creative / thought-provoking. Also, any suggestions on changes to the contents of the plan.

You're right on both instincts:

- It **looks strong, credible, and sellable** (important for B2B buyers)
- But it currently behaves like a **static report dashboard**, not a **working strategy tool**

That second point is the real risk. If it feels like something you *read once*, it won't be sticky.

---

1) The core issue: this is a "report", not a "workspace"

Right now the page answers:

> "What is the plan?"

But it doesn't answer:

> “What should I do next?”
> “What’s changed?”
> “Am I progressing?”

That’s the gap you’re feeling.

---

2) Is “corporate-y” a problem?

Not inherently.

In fact:

- For SMEs, trade orgs, consultants → this builds **trust**
- It signals **credibility and seriousness**

But…

> You need to layer in **energy + interactivity + ownership**

Otherwise it feels like:

- a PDF
- a consultant deliverable
- something static

---

3) What’s missing (the big 4)

1. Action layer (MOST important)

There is no sense of:

- tasks
- progress
- next steps

---

2. Scenario thinking

You've built a single plan.

But strategy tools feel powerful when users can say:

> "What if I did this differently?"

---

3. Decision tension

Everything looks "resolved".

But strategy is about trade-offs.

There's no:

- uncertainty
- alternatives
- flags

---

4. Ownership / interaction

User is passive.

No:

- editing
- adjusting
- reacting
- validating

---

4) Specific UI/UX improvements

A. Add a "Next Actions" panel at the top

Right under Decision Snapshot.

This is critical.

Replace part of this:

Static summary

With this:

Immediate Next Actions

- Shortlist 3 Australian distributors
- Validate pricing with 5 target customers
- Confirm CPTPP tariff classification
- Engage local legal advisor for ACCC review

Each with:

- checkbox
- owner
- due date

This alone massively increases stickiness.

B. Add a “Progress Tracker”

Left sidebar or top bar.

Example:

Market Entry Progress: 32%

- Market validated ✓
- Entry strategy selected ✓
- Partners identified ☐
- First sales ☐

This gives:

- forward motion

- reason to return

C. Turn modules into interactive cards

Right now:

> modules = read-only panels

Instead:

Add actions to each:

SWOT

- “Edit”
- “Regenerate”
- “Add insight”

Competitors

- “Add competitor”
- “Mark as priority threat”

Customer Journey

- “Test assumption”
- “Add channel”

This makes it feel alive.

D. Introduce “Assumptions & Confidence”

You already show:

> Plan confidence: 78%

Good.

But it’s unexplained.

Add:

Key assumptions

- AU demand for sustainable textiles continues (+22% YoY)
- price positioning holds at 20% below premium local brands
- distributor margins at 25–30%

Each with:

- confidence score
- “validate” action

Now it becomes:

> a thinking tool, not just output

E. Add “Scenario switcher” (this is a big one)

Top of page:

Current Strategy: Uppsala (Staged Entry)

Add:

- Compare with JV
- Compare with Direct-to-Market
- Duplicate & edit plan

This enables:

> exploration

Which is where real value comes from.

F. Add “Insights / AI recommendations layer”

Right now everything is neutral.

You need moments of:

> “this is interesting”

Example:

Insight callouts (small cards)

- “Australia shows above-average growth for sustainable apparel vs OECD markets”
- “Competitor concentration is high in mid-market segment — premium niche opportunity”
- “Fast-track ABN registration reduces time-to-market by ~6 weeks”

These create:

- curiosity
- perceived intelligence
- differentiation vs generic dashboards

---

5) Content improvements (important)

A. SWOT is too generic

SWOT is useful internally but weak as a product output.

Replace or enhance with:

“Strategic Positioning”

- Where you win
- Where you lose
- Strategic edge

More directional, less descriptive.

B. Customer Journey is good, but passive

Make it actionable:

Instead of:

> Awareness → Instagram, blogs

Add:

- expected CAC per channel
- conversion benchmarks
- priority channels

C. Competitor table → needs structure

Right now:

- static list

Make it strategic:

Add columns:

- price positioning
- channel strategy
- differentiator

Or cluster visually:

- premium
- fast fashion
- ethical niche

D. PESTLE + Porter’s → too academic

These are good for depth, but:

> they shouldn’t dominate the experience

Instead:

- collapse them by default
- surface only key implications

Example:

Regulatory insight:
Low barriers, but compliance review needed for marketing claims

---

E. Missing: “Entry Strategy Execution”

This is the biggest content gap.

You have:

- strategy
- analysis

But not:

how to actually enter

Add a section:

Entry Execution Plan

Market entry route:
Distributor-led

Steps:

1. Identify 10 target distributors
2. Outreach & pitch
3. Negotiate margin
4. Pilot with 2 partners
5. Expand

With:

- timelines

- owners
- costs

---

6) Make it feel more “creative / thought-provoking”

This is subtle but important.

Right now it’s:

> structured, safe, predictable

To add creativity:

A. Add “What would change this plan?”

Example:

- If AUD weakens by 10%
- If competitor enters premium segment
- If logistics costs rise 20%

This introduces:

> strategic thinking

B. Add “Top 3 strategic choices”

Instead of one path:

- Go premium niche
- Compete on price
- Partner with ethical retailers

Each with:

- pros / cons

C. Add visual hierarchy + contrast

Right now everything is similar weight.

Introduce:

- bigger hero insight
- stronger highlights
- fewer but more meaningful colors

---

7) The single biggest upgrade you can make

If you only do one thing:

> **Turn this from a plan viewer into a plan execution workspace**

That means:

- tasks
- progress
- assumptions
- iteration
- comparison

Final framing

What you have now is:

> **Phase 1: Insight & Planning Dashboard**

What you need to evolve into:

Phase 2: Strategy Execution Platform

That shift is what makes it:

- sticky
- monetisable long-term
- defensible

If you want, I can next:

- redesign this exact screen into a **“v2 layout” wireframe with specific components and placement**
- or define the **core objects (tasks, assumptions, scenarios) for your data model**, which is the next big step technically

Good. Review the next page.

This page is **much stronger structurally than the Overview**, but it has the same underlying issue:

it’s still a **diagnostic report**, not a **decision + action workspace**

The difference is subtle but critical.

Right now it answers:

“Are we ready?”

But it doesn’t answer:

> “What do we need to fix to enter this market successfully — and what should we do first?”

---

1) What’s working well (keep this)

You’ve got some very solid foundations here:

✔ Clear structure

- Company overview → readiness → model → product → partnerships
  This flows logically.

✔ The readiness score concept is strong

This is one of your most valuable product features.

If done right, this becomes:

> a benchmark tool users return to

✔ Business Model Canvas inclusion

This is actually a smart move.

It anchors the strategy in something tangible.

✔ Partnership readiness check

This is closer to “actionable” than most other sections.

---

2) Where it falls short

A. It’s descriptive, not directional

Everything tells me:

- what exists
- what status is

Nothing tells me:

> “Fix this first”
> “This is blocking your entry”
> “You are not ready because of X”

B. The readiness score is passive

You show:

> 80 / 100

But the user immediately thinks:

- Is that good?
- What’s missing?
- What do I fix?
- What’s the impact?

Right now, it’s just a number.

C. Business Model Canvas is too static

It looks like a slide from a strategy deck.

But:

- no prioritisation
- no validation
- no “fit to market”

D. Product portfolio is under-leveraged

You show:

- products
- pricing
- readiness

But you don't answer:

> Which product should we lead with in Australia?

That's a massive missed opportunity.

E. No link to execution

Same problem as before.

Nothing connects this page to:

- tasks
- milestones
- actions

---

3) High-impact changes (this is where you unlock value)

A. Turn "Readiness Score" into a decision engine

Instead of:

> 80 / 100

Make it:

Market Entry Readiness: 80 / 100

Status: Ready with conditions

Critical gaps to address:

- No Australian distributor secured
- Export experience limited
- Supply chain scalability risk

Then add:

Top 3 actions to improve readiness

1. Secure AU distributor partner
2. Run pilot export shipment
3. Validate logistics cost structure

Now the score becomes useful.

B. Add “Blocking vs Non-blocking gaps”

This is very powerful.

Readiness breakdown:

Blocking issues (must fix before entry)

- Distributor agreement not signed
- Export insurance incomplete

Non-blocking improvements

- Improve digital localisation
- Expand product range for AU market

This immediately creates clarity.

C. Transform Business Model Canvas → “Market Fit Canvas”

Right now it’s generic.

Instead:

> adapt it to Australia specifically

Add a toggle:

Current Model | Australia Adaptation

Then show changes:

Value Proposition (AU adjusted)

- Sustainability messaging (stronger emphasis)
- Pricing adjusted for premium niche

Channels (AU specific)

- Marketplace + DTC hybrid
- Local distributor channel

This makes it feel tailored, not templated.

D. Add “Product Entry Strategy” (this is a big one)

Your current product table is descriptive.

Make it strategic.

Add a new section:

Recommended Entry Product Mix

Primary launch product
→ EcoBasic Tees
Reason:

- strong margin
- broad appeal
- ready for export

Secondary expansion
→ Linen Collection
→ Active Range

Hold / delay
→ Kids Organic
Reason:

- not market-ready
- regulatory considerations

This turns data into decisions.

E. Upgrade “Partnership Readiness” into workflow

This section is close — push it further.

Instead of:

Pass / In Progress

Add:

- owner
- deadline
- next step

Example:

AU distributor agreement
Status: In progress
Next step: Finalise margin terms
Owner: Sales lead
Deadline: 2 weeks

Now it becomes usable.

F. Add “What’s holding you back?” banner (top of page)

This is one of the most effective UX patterns you can add.

Example:

🚧 **You are not fully ready to enter Australia yet**

To proceed, you must:

- secure a distributor
- complete export insurance
- validate logistics costs

This creates urgency and clarity.

G. Introduce “What happens if you ignore this?”

This adds depth and makes it thought-provoking.

Example:

Risk if distributor not secured:
→ delayed entry by 3–6 months
→ higher CAC via direct channels

This elevates the product beyond a checklist.

---

4) Make it feel less “corporate” and more “alive”

Right now it feels like:

> internal audit / consultant deck

To make it feel more engaging:

A. Add narrative insight cards

Sprinkle across the page:

- “Your sustainability positioning is a strong fit for AU premium segment”
- “Export readiness is strong, but channel execution is the main risk”

B. Introduce visual prioritisation

Not everything should feel equal.

Use:

- highlights
- warnings
- emphasis

C. Reduce “grid density”

There’s a lot of boxes.

Consider:

- more whitespace
- fewer sections visible at once
- collapsible modules

---

5) Biggest missed opportunity on this page

If I had to pick one:

> You’re not connecting business readiness to market success

You should explicitly answer:

> “Based on your current state, what are your chances of succeeding in this market?”

Add:

Success Probability

Estimated probability of successful entry: 68%

To reach 80%+:

- secure distribution
- complete compliance
- optimise pricing

This is powerful and very monetisable.

Final thought

This page is very close to being genuinely differentiated.

Right now:

> it diagnoses the business

You want it to:

> **guide the business toward market entry readiness**

That shift is what makes it:

- actionable
- sticky

- worth paying for repeatedly

If you want, next I can:

- redesign this into a **“v2 Business Profile page wireframe”**
- or define the **exact scoring model behind readiness (weights, thresholds, logic)** so it becomes a defensible feature

Good, next one

This is the strongest page so far in terms of **analytical depth**, but it also exposes the biggest product risk:

> you’ve built a very good **analysis dashboard**, but it still doesn’t consistently answer **“so what should I do?”**

This page is very close to being genuinely powerful — it just needs to shift from **insight** → **decision** → **action**.

---

1) What’s working well (this is strong)

✔ The top metrics bar

- Market size, growth, segment, consumers

- Clean, scannable, credible

This is exactly what buyers expect.

✔ Opportunity Scorecard

This is one of your best components.

- Clear scoring
- Easy comparison
- Good visual hierarchy

This is core IP if you develop the scoring logic properly.

✔ Competitor positioning map

Very good.

- Visual
- Strategic
- Differentiated vs generic tools

This is the kind of thing users remember.

✔ Porter’s Five Forces (but…)

Good depth, but currently too “academic” (we’ll fix that below).

---

2) The core problem

Right now, the page answers:

> “Is this an attractive market?”

But it doesn clearly answer:

> “How should I win in this market?”

That’s the missing layer.

---

3) What needs to change (high impact)

A. Add a “Market Verdict” at the top

Right now:

- you show data
- you show scores

But you don’t give a clear **recommendation**

Add:

Market Verdict: Attractive with Competitive Pressure

Why:

- strong market size (£8.4B) and growth (6.2%)
- high ease of entry
- but intense competition in mid-market

Implication:
→ Enter via **premium ethical niche positioning**, not mass market

---

This instantly turns analysis into strategy.

B. Add “Recommended Market Strategy”

This is the single biggest missing piece.

Example:

Recommended Approach for Australia

Positioning
→ Premium sustainable niche (not price-led)

Target segment
→ Gen Z / Millennial ethical consumers

Channel strategy
→ DTC + curated marketplaces + selective wholesale

Pricing
→ 10–20% below premium competitors

This connects:

- scorecard
- competitors
- trends

Into one coherent strategy.

C. Upgrade the Opportunity Scorecard → make it explain itself

Right now:

- scores are good
- but not justified clearly

Add hover / expandable logic:

Market Size: 8/10

- £8.4B market
- top 10 globally

Ease of Entry: 9/10

- low tariffs (CPTPP)
- strong e-commerce infrastructure

This builds trust and avoids “black box scoring”.

D. Replace or evolve SWOT

SWOT is fine internally, but:

> it’s not a strong product output

Replace with:

Strategic Implications

Where you win

- sustainability positioning aligns with AU demand
- strong DTC capability

Where you struggle

- no local presence
- high competition in mid-tier pricing

This is far more useful.

E. Transform Porter’s Five Forces → “Market Pressure Map”

Right now it’s:

> academically correct, but passive

Reframe as:

Market Pressure Summary

High pressure areas

- Competitive rivalry (85%)
- Substitutes (80%)

Moderate pressure

- Buyer power (price sensitivity)

Low pressure

- New entrants (barriers exist)

Then add:

Strategic implication:
→ Avoid competing on price
→ Focus on differentiation + brand story

Now it drives decisions.

F. Upgrade competitor section → make it strategic

Right now:

- nice map
- static table

Add:

Competitive Gap Analysis

Overcrowded zones

- mid-price sustainable brands

Underserved zones

- premium ethical + strong storytelling

Then:

Your recommended position (highlighted on map):
→ slightly below Patagonia pricing
→ stronger sustainability narrative

This turns the visual into a decision tool.

G. Make “Key Trends” actionable

Right now:

- trends are descriptive

Upgrade to:

Key Trends → Actions

Trend: E-commerce growth
→ Invest in AU-specific Shopify storefront

Trend: Social commerce
→ Prioritise TikTok + Instagram partnerships

Trend: Premium polarisation
→ Avoid mid-market positioning

This is a simple but high-impact change.

---

4) Add “Entry Risks specific to THIS market”

You have general risk elsewhere.

But you need:

Market-Specific Risks

- strong local brand loyalty
- high return rates in apparel e-commerce
- logistics costs to AU

Then:

Mitigation:

- partner with local distributor
- test pricing early
- optimise shipping strategy

---

5) Make it feel more “thought-provoking”

Right now it’s:

> informative, structured, safe

You want moments of:

> “that’s interesting”

A. Add “Contrarian insight”

Example:

> “Despite high competition, premium sustainable brands are outperforming fast fashion in growth segments”

B. Add “What would change this recommendation?”

- if growth drops below 3%
- if competitor enters premium niche
- if tariffs change

This creates depth and strategic thinking.

---

6) Reduce “corporate feel” without losing credibility

You don’t need to make it “fun”.

You need to make it:

> **alive and opinionated**

Do this by:

- adding recommendations (not just data)
- highlighting key insights
- reducing passive frameworks
- increasing “so what” statements

---

7) The single biggest upgrade for this page

If you do one thing:

> **Add a clear “How to win in this market” section**

Everything else becomes supporting evidence.

Final framing

Right now:

> this page = market intelligence dashboard

You want:

market strategy engine

Once you add:

- verdict
- positioning
- actions

This becomes something users:

- trust
- return to
- and actually use to make decisions

If you want, next I can:

- redesign this into a **“v2 Market Opportunity page with exact layout + components”**
- or define the **algorithm that links scorecard → recommended strategy automatically**, which is where your product becomes very differentiated

next

This is the most important page in your entire product.

And right now it’s **good structurally, but underpowered strategically**.

Why?

Because this is where users expect:

> “Tell me exactly how to enter this market”

But what they’re getting is still closer to:

> “Here is a structured summary of a strategy”

That’s a subtle but critical gap.

---

1) What’s working (this is a strong foundation)

✔ The staged entry layout (top section)

This is excellent.

- Clear phases
- Visual progression
- Matches Uppsala model well

This is one of your strongest UI components so far.

✔ Timeline + investment framing

Very good.

- Makes strategy feel real
- Anchors expectations

✔ Value Proposition Canvas (current vs AU)

Smart inclusion.

- Shows adaptation

- Reinforces localisation thinking

✔ Channel breakdown + marketing blocks

Good structure.

Feels practical.

---

2) The core issue

This page answers:

> “What is the strategy?”

But not strongly enough:

> “Why this strategy over alternatives?”
> “What decisions are being made?”
> “What should I do first, next, and now?”

---

3) High-impact improvements

A. Add “Why this strategy?” (top of page)

Right now you jump straight into the plan.

That’s a mistake.

Add a strip above the phases:

Why this approach

Recommended model: Staged entry (Uppsala)

Chosen because:

- low-risk market validation required
- strong DTC capability already exists
- high competition → avoid upfront heavy investment

Not chosen:

- JV → higher cost and complexity
- Born Global → too risky given limited AU presence

This builds trust and reinforces decision logic.

B. Turn phases into decision gates (critical upgrade)

Right now phases are linear.

Make them conditional.

Instead of:

Phase 1 → Phase 2 → Phase 3

Use:

Phase 1: Digital Export (Months 1–6)

Objective: Validate demand

Success criteria (gate to Phase 2):

- £X monthly revenue
- CAC below £X
- repeat purchase rate > X%

Phase 2: Distributor Partnership

Trigger:
→ Phase 1 KPIs achieved

Phase 3: Local Subsidiary

Trigger:
→ distributor revenue > £X

This is HUGE.

Now the strategy feels:

- intelligent
- adaptive
- real-world

C. Add “What could go wrong?” per phase

Right now it’s too clean.

Add:

Phase 1 Risks

- high CAC in AU market
- low conversion from social

Mitigation:

- test pricing early
- focus on influencer channels

This adds depth and realism.

D. Add “Immediate actions” panel (again — critical)

Even here, still missing.

At top:

Next 5 Actions

1. Set up AU Shopify storefront
2. Register ABN + GST
3. Shortlist 5 distributors
4. Launch test campaigns
5. Set pricing benchmarks

This ties the strategy to execution.

E. Upgrade Customer Journey → make it measurable

Right now:

- descriptive

- static

Add metrics:

Awareness

- expected CPC
- CTR benchmark

Consideration

- conversion rate

Purchase

- AOV target

Now it becomes usable.

F. Value Proposition Canvas → sharpen it

Right now it’s a bit generic.

Add a “key shift” callout:

Key Market Adaptation

→ stronger emphasis on sustainability transparency
→ reposition from “affordable ethical” to “accessible premium”

This makes it feel strategic, not templated.

G. Marketing & Distribution → prioritise

Right now everything feels equal.

Add:

Primary channels (focus first)

- Instagram / TikTok
- THE ICONIC marketplace

Secondary channels

- email automation
- SEO

This helps users know where to start.

H. Add “Expected outcomes by phase”

This is a powerful addition.

Phase 1 outcome:

- £X revenue
- validated demand

Phase 2 outcome:

- £X wholesale revenue
- brand presence established

Phase 3 outcome:

- local scale achieved

Now users see the progression clearly.

I. Add “Alternative strategy toggle” (important)

Even on this page.

At top:

Compare with:

- JV-led entry
- Direct DTC only

This reinforces:

> this is a choice, not a fixed answer

---

4) Make it feel more creative / thought-provoking

Right now it's:

> structured and safe

To elevate:

A. Add "Strategic insight" callouts

Example:

> "Entering via DTC first allows brand control but requires strong CAC discipline in Australia"

B. Add "Key trade-offs"

This is missing everywhere.

Example:

Trade-off:

- Lower risk (Uppsala)
  vs
- slower market penetration

This makes the strategy feel real.

---

5) Content gaps

Missing: "Resource requirements"

Users need to know:

- team needed
- skills required
- hiring plan

Missing: “Partnership strategy detail”

You mention distributors, but not:

- what type
- how to choose
- what good looks like

Missing: “Execution ownership”

Who does what?

Even lightweight:

- founder
- marketing lead
- ops

---

6) The single biggest upgrade

If you only change one thing:

> **Turn phases into conditional, KPI-driven decision stages**

That transforms this from:

- a plan

into:

- a **strategy engine**

Final framing

Right now:

> this page = structured strategy output

You want:

> **interactive, conditional execution strategy**

Once you add:

- decision gates
- actions
- trade-offs
- alternatives

This becomes something users:

- actively use
- revisit
- rely on to make decisions

If you want, next I can:

- design the **exact logic for phase triggers + KPI thresholds**
- or turn this into a **fully interactive “strategy builder flow” (step-by-step UX)** which would be a major product unlock

next

This page is **very close to being commercially powerful**, but right now it sits in an awkward middle:

> it looks like a financial model
> but behaves like a **static summary of assumptions**

For your product, this page should be:

> **a decision simulator, not a reporting dashboard**

That's the shift that turns this into something people actually rely on.

---

1) What's working well

✔ Strong visual clarity

- Revenue ramp chart → excellent
- KPI tiles → clean and executive-friendly
- Cost structure → clear and credible

This already looks like something you could show to:

- a founder
- an investor

- a board

That's valuable.

✔ Logical structure

- KPIs → revenue → projections → costs → resources

Very solid flow.

✔ 3-year projection tied to phases

This is particularly good because it links:

- strategy → financial outcomes

That's exactly what you want.

---

2) The core issue

Right now, this page answers:

> "What does the financial plan look like?"

But not:

> "What happens if I change something?"
> "What is driving these numbers?"
> "Where is the risk?"
> "What should I optimise?"

---

3) The biggest opportunity

This page should be:

interactive, scenario-driven, and assumption-transparent

Right now, it's none of those.

---

4) High-impact improvements

A. Add "Key assumptions" (critical)

This is the biggest gap.

Add a panel:

Key Financial Assumptions

- CAC: AUD 38
- Conversion rate: 2.4%
- Average order value: AUD 85
- Gross margin: 62%
- Distributor margin: 25%

Then:

Add **confidence level** + "adjust" button

This solves:

- trust
- transparency
- usability

B. Turn this into a “what-if simulator”

This is your biggest product unlock.

Add sliders / controls:

- CAC (±20%)
- conversion rate
- pricing
- marketing spend
- distributor margin

Then dynamically update:

- revenue
- breakeven
- ROI

This turns the page into:

> something users actively engage with

C. Add “Sensitivity insights”

Even without sliders, you can show:

What impacts your model most?

- CAC → HIGH impact
- Conversion rate → HIGH impact
- Pricing → MEDIUM
- Logistics cost → LOW

This is extremely valuable.

It tells users:

where to focus

D. Add “Financial risks”

Right now everything looks smooth.

Too smooth.

Add:

Key Risks

- CAC higher than expected in AU
- logistics costs underestimated
- distributor margin pressure

With impact:

→ breakeven delayed by 3–5 months

This adds realism and trust.

E. Make breakeven more visual

Right now:

Month 14

Improve:

Overlay breakeven point on the chart.

Or:

Show:

Cash flow curve → crosses zero at Month 14

This makes it intuitive.

F. Add “Scenario comparison”

You already have models.

Use them.

Add:

Compare scenarios

Scenario	Revenue	Breakeven	ROI
Uppsala (current)	1.2M	Month 14	285%
JV	1.6M	Month 18	240%
DTC only	900K	Month 10	190%

This is extremely powerful.

G. Link numbers to strategy (missing)

Right now:

- numbers are separate from strategy

Add annotations:

Year 2 jump explained:
→ distributor channel activation

Margin dip in Phase 2:
→ wholesale pricing impact

This helps users understand *why*.

H. Upgrade cost structure → make it actionable

Right now:

- descriptive

Add:

Optimisation opportunities

- reduce logistics costs via local warehousing
- improve CAC via influencer partnerships

This connects:

> finance → action

I. Add “Investment required vs available”

This is very important commercially.

Add:

Funding requirement

- total investment: AUD 340K
- internal capacity: AUD 250K
- funding gap: AUD 90K

Now this becomes:

> decision-critical

---

5) Make it feel less “corporate” and more “alive”

Right now it feels like:

> static financial report

To improve:

A. Add narrative insight

Example:

> “Profitability is driven primarily by strong DTC margins in Phase 1, with scale achieved through distributor expansion in Year 2”

B. Highlight key moments

- breakeven
- scale inflection point
- margin shift

C. Reduce uniformity

Everything looks equal weight.

Introduce:

- emphasis
- highlights
- contrast

---

6) What’s missing entirely

A. Cash flow (very important)

Revenue ≠ cash.

Add:

- burn rate
- runway

B. Unit economics

You mention CAC, but:

Add:

- LTV
- contribution margin per order

C. Payback period

Critical for founders.

---

7) The single biggest upgrade

If you only do one thing:

> **Turn this into an interactive “what-if” financial simulator**

That changes everything.

Final framing

Right now:

> this page = financial summary

You want:

> **financial decision engine**

Once you add:

- assumptions
- sliders
- sensitivity
- scenarios

This becomes:

- highly engaging
- highly valuable
- very hard to replicate

This is one of the areas where you can create real product differentiation vs:

- consultants
- static tools
- generic AI outputs

If you want, next I can:

- define the **exact set of adjustable variables + formulas for your simulator**
- or map how this page connects into **scenario comparison + pricing tiers (monetisation strategy)**

next

This page is **functionally solid but strategically underpowered**.

It’s doing a good job of:

cataloguing risk

But not a good enough job of:

helping users *manage, prioritise, and act on risk*

Right now it feels like:

a compliance + consulting deliverable

You want it to feel like:

a **live risk management cockpit**

---

1) What’s working well

✔ Risk register table

- Clear structure (risk / probability / impact / mitigation)
- Easy to scan
- Feels credible

✔ Risk matrix (visual)

Nice touch.

Gives a quick mental model of:

- high vs low impact
- probability

✔ Legal & compliance checklist

This is strong and **very practical**.

This is one of your most “sticky” features:

- users actually need to complete these tasks

✔ Summary counts (3 high / 4 medium / etc.)

Good top-level overview.

---

2) The core problem

Right now the page answers:

> “What are the risks?”

But not:

> “What should I do about them first?”
> “Which risks actually matter most to my success?”
> “How does this affect my plan?”

---

3) The biggest issue

Everything is treated equally.

But in reality:

> 2–3 risks will determine success or failure

You’re not surfacing that.

---

4) High-impact improvements

A. Add “Top Risks to Address Now” (critical)

This should be the first thing users see.

Add at top:

🚨 Critical Risks Requiring Action

1. **ACCC compliance breach**
   → could delay launch by 2–3 months
2. **AUD/SGD currency volatility**
   → could reduce margin by 8–12%
3. **Price competition from Cotton On**
   → risk of losing mid-market positioning

This creates:

- urgency
- clarity
- focus

B. Add “Risk impact on plan”

This is missing everywhere.

For each high risk:

If unresolved:

- delay Phase 2 by X months
- increase CAC by X%

- reduce margin by X%

This connects risk → strategy → finance.

Very powerful.

C. Turn mitigations into actions

Right now:

> mitigation = passive suggestion

Change to:

- action
- owner
- deadline

Example:

ACCC compliance

Current:
"Engage AU trade lawyer"

Upgrade to:

- Action: Engage AU trade lawyer
- Owner: Legal
- Deadline: 2 weeks
- Status: Not started

Now this becomes executable.

D. Add “Risk ownership”

Critical for real usage.

Add column:

- Owner (e.g. founder, ops, legal)

Without this:

> no accountability

E. Add “Risk trend / status”

Not all risks are static.

Add:

- improving
- worsening
- stable

This makes it feel like a **live system**

F. Make the matrix interactive (or more meaningful)

Right now:

- nice visual
- but passive

Improve:

- highlight *your* top risks on the matrix
- allow hover → show details

Or even:

- “your current risk profile”

G. Upgrade compliance checklist → make it a workflow

This section is close to being excellent.

Push it further.

Add:

- due dates
- owners
- priority

Example:

Fair Work Act — AU employment contracts
Status: In progress

Owner: HR
Deadline: 3 weeks

H. Add “What happens if all risks are mitigated?”

This is a powerful framing.

Example:

Risk-adjusted outcome

If key risks mitigated:

- breakeven improves from Month 14 → Month 12
- margin increases from 62% → 66%

Now risk becomes:

> something you can actively improve

I. Add “Residual risk score”

Right now:

> risk score = 6/10

But unclear what that means.

Improve:

- current risk: 6/10
- after mitigation: 4/10

This shows progress.

J. Add “Risk vs opportunity trade-offs”

Very underused concept.

Example:

Risk: higher CAC in AU

Trade-off:
→ faster brand growth via paid channels

This adds strategic depth.

---

5) Make it feel less “corporate” and more “alive”

Right now it feels like:

> risk register spreadsheet

To improve:

A. Add narrative insights

Example:

> “Your biggest risk is not regulatory — it’s competitive pricing pressure in the mid-market segment”

B. Highlight key risks visually

Use:

- callouts
- icons
- emphasis

C. Reduce table dominance

Right now:

- table is doing all the work

Add:

- summaries
- insights
- prioritisation

---

6) Content gaps

A. Missing: “Strategic risks”

You focus mostly on:

- operational

- compliance

Add:

- brand positioning risk
- channel strategy risk
- product-market fit risk

B. Missing: “External shocks”

- currency shifts
- regulatory change
- competitor entry

C. Missing: “Execution risk”

- team capability
- hiring delays
- partner reliability

---

7) The single biggest upgrade

If you only change one thing:

> **Turn mitigation into trackable actions with owners and deadlines**

That alone transforms this page from:

- informative

to:

- operational

Final framing

Right now:

> this page = risk documentation

You want:

> **risk management system**

Once you add:

- prioritisation
- ownership
- action tracking
- impact on outcomes

This becomes:

- genuinely useful
- revisited regularly
- hard to replace

You're very close across all pages.

The consistent pattern is:

> great structure + strong thinking
> but missing:
> **action, ownership, and iteration**

If you want, next I can:

- design the **Execution Roadmap page (this is where everything should come together)**
- or define the **core "task + risk + milestone" data model**, which is the backbone of making this a real platform rather than a planning tool

next

This is the page where your product either **becomes truly valuable**… or stays a planning tool.

And you're *very close* — structurally this is strong — but right now it still behaves like:

> a **timeline visualisation**

Instead of:

> a **live execution system**

---

1) What's working really well

✔ Phase-based roadmap (Foundation → Distribution → Scale)

This is excellent.

- Clear narrative
- Matches your strategy
- Feels realistic

This gives users confidence.

✔ Milestones timeline (left side)

Very strong.

- Concrete
- Time-bound
- Easy to follow

This is one of your best components.

✔ Gantt-style workstream view

Good addition.

- Shows complexity
- Shows overlap
- Feels “serious”

✔ Breakeven highlight

Nice touch.

Gives a clear “moment that matters”.

---

2) The core problem

This page answers:

> “What is the plan over time?”

But not:

> “What do I need to do this week?”
> “What’s at risk right now?”
> “Am I on track?”

---

3) The fundamental gap

There is **no sense of execution state**.

Everything looks:

- predefined
- static
- already decided

But execution is:

- messy
- dynamic
- constantly shifting

---

4) The biggest opportunity

This page should feel like:

> **a live operating dashboard**

Not a static roadmap.

---

5) High-impact improvements

A. Add “Current Focus” (critical)

This is the single most important missing piece.

At the very top:

🔥 Current Focus (Month 2)

Priority objectives:

- Launch AU Shopify store
- Finalise ABN & GST registration
- Start paid acquisition testing

This week's actions:

- Set up payment + Afterpay
- Launch 3 test campaigns
- Shortlist 3 logistics partners

This instantly makes it:

- actionable
- alive
- sticky

B. Add task tracking layer (non-negotiable for stickiness)

Right now:

- tasks are implied
- not trackable

Convert roadmap items into:

- checkbox tasks
- status (not started / in progress / done)
- owner

Example:

Launch AU Shopify store

- [✓] Domain setup
- Payment integration
- Local pricing

Without this:

> users won’t come back

C. Add “Progress tracking”

You already have plan confidence — good.

Now add execution progress.

Example:

Execution Progress

- Phase 1: 40% complete
- Overall plan: 18% complete

This creates momentum.

D. Add “At risk” indicators

Tie this page to your Risk module.

Example:

⚠ At Risk

- ABN registration delayed
- CAC higher than expected

This connects:

- plan ↔ reality

E. Make milestones measurable

Right now milestones are:

> descriptive

Upgrade to:

Month 3 — First 500 AU orders

Add:

- current: 180
- target: 500
- status: behind

Now users can track performance.

F. Upgrade Gantt → make it interactive (or more meaningful)

Right now:

- visually nice
- not very actionable

Improve:

- highlight current time window
- show progress within bars
- flag delayed items

Or simplify:

- fewer workstreams
- more clarity

G. Add “Dependencies”

This is missing and very important.

Example:

Distributor agreement depends on:

- product validation
- pricing strategy
- logistics setup

This helps users understand:

what unlocks what

H. Add “Decision points”

You already defined phases earlier — now connect them.

Example:

Month 6 Decision Gate

If:

- revenue > £X
- CAC < £X

→ proceed to distributor phase

This ties execution to strategy.

I. Add “Resource view” into roadmap

You show budget elsewhere, but not here.

Add:

- who is working on what
- when hiring happens

This helps:

> planning realism

J. Add “What’s next” CTA

At any point, user should see:

> “What should I do next?”

Example:

Next Step

→ Complete AU compliance checklist (2 items remaining)

This is key for engagement.

---

6) Make it feel less corporate, more like a workspace

Right now:

> looks like a consulting deliverable

To shift:

A. Add interactivity

- checkboxes

- updates
- progress

B. Add real-time feel

- “updated today”
- status indicators

C. Add ownership

- who is responsible

D. Add friction

- incomplete items
- warnings

This creates:

> tension → engagement

---

7) Content gaps

Missing: Execution risk linkage

You defined risks — but not connected here.

Missing: Feedback loops

- learning from Phase 1
- adapting plan

Missing: Iteration

Plan looks fixed — it shouldn't.

---

8) The single biggest upgrade

If you only do one thing:

> **Turn roadmap items into trackable tasks with status + ownership**

This alone transforms the product.

---

9) Big picture (across all pages)

You now have:

- Strategy ✔
- Market analysis ✔
- Financials ✔
- Risk ✔
- Roadmap ✔

But what's missing is:

> **a unifying execution layer**

The real product opportunity

Right now you've built:

> a very strong planning platform

To make it a business:

> you need to become an **execution platform**

What that means

Across all pages:

- tasks are trackable
- risks affect execution
- financials update based on reality
- milestones show progress

Final framing

This page should feel like:

> "This is what I'm doing this week to enter Australia"

Not:

> "This is a plan for entering Australia"

If you want, next I can:

- design the **exact data model (tasks, risks, milestones, KPIs) that connects all pages**
- or map the **full product loop (plan → execute → track → adapt)** which is what turns this into a scalable SaaS rather than a one-time tool

next

This is a **high-potential page** — arguably where your product becomes *strategically differentiated* — but right now it's still behaving like:

> a **comparison table + scenario summary**

Instead of:

> a **decision-making engine under uncertainty**

That's the shift you need to make.

---

1) What's working well

✔ Model comparison table

This is strong.

- Clear dimensions (speed, investment, control, etc.)
- Easy to scan
- Good for first-pass understanding

✔ Scenario matrix (best / base / downside)

Also strong.

- Introduces uncertainty (important)
- Adds realism
- Good narrative

✔ Recommendation banner

Good concept:

- explains *why* Uppsala is selected
- adds context

---

2) The core problem

Right now, the page answers:

> "How do the models compare?"

But not:

> "Which should I choose, given trade-offs?"
> "What happens if things change?"
> "How confident should I be in this decision?"

---

3) The biggest issue

This page is **too static for something inherently dynamic**.

Scenario planning should feel:

- interactive
- exploratory
- decision-driven

---

4) High-impact improvements

A. Make the recommendation dynamic (critical)

Right now:

> “Recommended: Uppsala”

But it feels fixed.

Upgrade to:

Recommended Model: Uppsala

Confidence: 78%

Why:

- best balance of risk vs investment
- aligns with current financial capacity

Then add:

If priorities change:

- choose Born Global → faster growth, higher risk
- choose OLI → higher control, higher cost

This shows:

it's a *decision*, not a rule

B. Add "Decision levers" (game changer)

Let users influence the recommendation.

Add sliders:

- Risk tolerance (low ↔ high)
- Investment capacity
- Speed priority
- Control preference

Then:

→ dynamically update recommended model

This turns the page into:

an interactive strategy tool

C. Add "Trade-off summary"

This is missing everywhere, but critical here.

Example:

Key Trade-offs

Uppsala

- Low risk
- Lower upfront cost
  – Slower scale

Born Global

- Fast growth
  – High burn + risk

This helps users *think*, not just compare.

D. Make comparison table less static

Right now:

- rows are descriptive
- but not prioritised

Add:

Highlight most important dimensions

Example:

- risk level (bold)
- investment (bold)
- breakeven (bold)

Or:

Let users choose:
→ “rank what matters most”

E. Upgrade scenario planning → make it causal

Right now:

> scenarios are descriptive stories

Improve:

Best Case → driven by:

- strong TikTok performance
- early marketplace traction

Downside → driven by:

- high CAC
- regulatory delays

Then link to:

- risks page
- financial model

This connects the system.

F. Add “Probability-weighted outcome”

Right now:

- probabilities shown
- but not used

Add:

Expected Outcome (weighted)

- Revenue Yr1: AUD X
- ROI Yr3: X%

This gives:

> a single, useful summary

G. Add “Decision checkpoint”

Tie this back to execution.

Example:

Decision checkpoint (Month 6)

If:

- revenue < target
  → reconsider model (e.g. switch to distributor earlier)

This makes strategy:

> adaptive

H. Add “Model switching paths”

Very powerful concept.

Example:

Start with Uppsala → shift to OLI if:

- strong traction
- capital available

Start with Uppsala → fallback to DTC only if:

- distributor fails

This reflects reality.

I. Make scenarios feel more “alive”

Right now:

static cards

Add:

- “what triggers this scenario?”
- “early warning signals”

Example:

Downside early signal:
→ CAC rising above AUD 50

This helps users:

> detect risk early

J. Add “confidence + uncertainty framing”

Very important.

Example:

Confidence in forecast: Medium (±20%)

Drivers of uncertainty:

- CAC variability
- distributor performance

This builds trust.

---

5) Make it less corporate, more thought-provoking

Right now:

> clean, structured, safe

To elevate:

A. Add tension

Highlight:

- what could go wrong
- what's uncertain

B. Add "what would change this decision?"

Example:

> If investment capacity doubled, Born Global becomes viable

C. Add "contrarian view"

Example:

> "Despite higher ROI potential, Born Global is not recommended due to execution risk"

---

6) Content gaps

Missing: "Time to regret"

- how long before you know you chose wrong?

Missing: "Switching cost"

- how hard is it to change models?

Missing: “Organisational fit”

- team capability required per model

---

7) The single biggest upgrade

If you only do one thing:

> **Add decision levers (sliders) that dynamically change the recommended model**

That’s your differentiation.

---

8) Big picture (final page insight)

This page is where you can prove:

> this is not just an AI planning tool
> this is a **decision intelligence platform**

Final framing

Right now:

> this page = comparison + scenarios

You want:

> **interactive strategic decision system**

Once you add:

- sliders
- trade-offs
- dynamic recommendations
- scenario logic

This becomes:

- highly engaging
- highly valuable
- very hard to replicate

Overall product feedback (now that I've seen everything)

You've built:

> a **very strong, well-structured planning product**

To make it commercially powerful:

You need to layer in:

1. Action

- tasks
- ownership
- tracking

2. Adaptation

- scenarios
- decision points
- iteration

3. Interactivity

- sliders
- toggles
- dynamic outputs

That’s the difference between:

“interesting tool”
vs
“something businesses actually run their expansion on”

If you want, I can next:

- map the **end-to-end product architecture (data + UX + logic)**
- or define **your core differentiator vs competitors like consultants, Notion templates, or generic AI tools**

next

This is the most “consulting-grade” page in your product — and also the one that currently feels **least like a product**.

Right now it’s:

> very thorough, very credible…
> but **too static, too dense, and not decision-oriented enough**

You’ve essentially built a high-quality **PESTLE report**.

What you need is:

> a **PESTLE decision layer that feeds strategy and execution**

---

1) What’s working well

✔ Strong top summary

- “High opportunity, manageable complexity” → excellent
- Feels like a real insight, not generic AI text

This is exactly the right direction.

✔ Structured breakdown (Political, Economic, etc.)

- Clear
- Comprehensive
- Logical

✔ Key factors + watch points

Good depth.

Feels like something a consultant would deliver.

✔ Action items (important)

You’ve already started bridging into execution here — that’s great.

---

2) The core problem

This page answers:

> “What’s happening in the macro environment?”

But not:

> “So what does this mean for my entry strategy?”
> “What should I actually change or do differently?”

---

3) The biggest issue

It’s too:

- text-heavy
- passive
- evenly weighted

Everything feels equally important, when in reality:

> only a few factors actually matter strategically

---

4) High-impact improvements

A. Add “PESTLE → Strategy Impact” (critical)

This is the single biggest missing piece.

Add at the top:

Strategic Implications

What matters most:

- strict ACCC regulation → requires compliance-first launch

- strong sustainability demand → supports premium positioning
- high AUD volatility → requires pricing flexibility

What this means for your strategy:

→ Enter via **DTC first to control brand narrative**
→ Position as **certified ethical premium (not mid-market)**
→ Implement **currency hedging / dynamic pricing early**

This transforms the page from:

- descriptive → prescriptive

B. Add “Top 5 Factors That Actually Matter”

Right now:

- too many inputs

Add:

Key Drivers (ranked)

1. ACCC regulatory enforcement
2. Sustainability demand (Gen Z)
3. Currency volatility
4. E-commerce maturity
5. Trade agreements (CPTPP)

This creates focus.

C. Collapse the detail by default

Right now:

- everything is expanded
- visually overwhelming

Improve UX:

- show summary view first
- allow expansion per section

This makes it:

- digestible
- more product-like

D. Upgrade “Action items” → connect to roadmap

Right now:

- actions are isolated

Instead:

Link actions to:

- Execution Roadmap
- Risk register
- Tasks

Example:

“Register IP in Australia” →
→ appears as task in roadmap
→ linked to risk (IP protection)

This connects your system.

E. Add “Risk vs Opportunity weighting”

Right now:

- you show “positive / mixed / neutral”

But that’s too vague.

Improve:

Political:

Opportunity: 7/10
Risk: 3/10

Legal:

Opportunity: 4/10
Risk: 7/10

This adds clarity.

F. Add “What would change this?” (very powerful)

Macro environments are uncertain.

Example:

If ACCC enforcement tightens further:

→ delay launch timeline

If AUD weakens significantly:

→ margin improves

This introduces dynamic thinking.

G. Add “PESTLE impact on financial model”

Right now:

- disconnected

Example:

Currency volatility
→ impacts:

- COGS

- margins

Regulation
→ impacts:

- cost
- timeline

This connects macro → numbers.

H. Reduce text density

Right now:

too much reading

Improve:

- shorter bullet points
- highlight key phrases
- use icons / visual cues

I. Add “So what?” to every section

Each section should end with:

Example (Economic):

Insight:
Strong consumer spending + premium willingness

So what:
→ pricing power exists → avoid discount positioning

This is critical.

J. Add “Confidence level”

Some PESTLE inputs are uncertain.

Example:

- Economic outlook → Medium confidence
- Regulatory direction → High confidence

This builds trust.

---

5) Make it feel less corporate, more product-like

Right now:

> looks like a PDF report inside a UI

To fix:

A. Reduce vertical density

- too long

- too scroll-heavy

B. Increase interaction

- collapsible sections
- highlights
- links to other modules

C. Increase prioritisation

- not everything should feel equal

---

6) Content gaps

Missing: “Industry-specific impact”

Some insights are generic — make them sector-specific.

Missing: “Competitor reaction”

How will incumbents respond?

Missing: “Timing implications”

When should you enter?

---

7) The single biggest upgrade

If you only do one thing:

> **Add a “Strategic Implications” section that clearly translates PESTLE into actions**

Final framing

Right now:

> this page = macro analysis

You want:

> **macro → strategy → action engine**

Big picture (now you’ve shown all pages)

Across the whole product:

You’ve built:

> a **very strong, structured, credible planning system**

What’s missing (consistently):

1. Actionability

- what do I do next?

2. Interactivity

- what happens if things change?

3. Connection

- how do pages influence each other?

The real product opportunity

You are very close to building:

> a **“Notion + McKinsey + AI” for international expansion**

To get there:

- connect modules
- introduce state (progress, risk, status)
- make outputs adaptive
